

Manufactured Home Belly Insulation

PREPARATION

Manufactured-home floors should not be insulated if a plumbing leak cannot be repaired. Note: insulating manufactured home floors may help keep exterior moisture from moving up into the body.

Install a ground cover in the crawlspace. Six-mil black polyethylene UV-stabilized and opaque polyethylene, existing black 4-mil polyethylene may remain if it's in good condition.

- For non-ducted return systems (refer to 7.1 of [2016 BPA Residential Weatherization Specifications](#)). If the floor contains a non-ducted return system, seal the opening to the crawlspace and provide return air to a central location in the home.
- Extend all condensate and/or water drains to the outside of the crawlspace.
- Extend all types of appliance exhaust ducts to outside of the crawlspace. For duct types, refer to 7.1 of [2016 BPA Residential Weatherization Specifications](#).
- Seal all plumbing penetrations and ductwork in the belly or through the floor before installing underfloor insulation.
 - Repair or replace damaged skirting by bringing it as close to the ground as possible to reduce intrusion from animals.

Specification Checklist

[Download Checklist](#)

For details on all BPA requirements for this measure, please refer to the [2016 BPA Residential Weatherization Specifications](#).

- Materials used to patch the rodent barrier must be vapor-permeable, durable and capable of supporting the insulation.
- Repair all large holes in rodent barrier with stitch staples and approved materials.
- Determine if the belly is best insulated from the edge or underneath, depending on clearance and access.
- Blow only fiberglass insulation in the floor cavity of a manufactured home.
 - Blow to a density, from either beneath through belly or through edge, to a density of 1.25 lbs/ft³ to 1.75 lbs/ft³.

RECOMMENDED

- Identify and flag any combustion-air vents for furnaces, water heaters or stoves/fireplaces. Confirm they extend below the finished belly material.
- If a crossover duct is present, seal and insulate or replace.
 - Replaced crossovers should be rigid sheet metal and insulated to R-11.
 - Ensure crossover ducts are well supported and not in contact with the ground cover or ground.

Connect with the local serving utility to confirm pre- and post-condition requirements.

Pre-Condition:

R-0 to R-7
R-8 to R-11

Post-Condition:

R-11, R-22 or maximum possible
R-22 or maximum possible

MINIMUM REQUIRED DOCUMENTATION

You can use the [Optional Weatherization Data Collection Form](#) to collect this information. Contact the serving [utility](#) for specifics on required documentation.

- 1.** Documentation that the measure requirements have been met (e.g., manufacturer, model number, type, size and quantity of equipment or product installed or used).
- 2.** Documentation of pre-and post-insulation R-values, and square footage of installed insulation.
- 3.** Primary heating type.
- 4.** Invoice showing order or purchase date, cost, post-condition.
